SAVEETHA
INSTITUTE OF MEDICAL AND TECHNICAL SCIENCES
(Declared as Deemed to be University under Section 3 of UGC Act 1956)

Programme : B.E / B.Tech

Course Code : ITA14

Course Name : Ethical Hacking

Duration : 1: 30 Hr

Date : _____ Max Marks: 50 Marks

CONTINUOUS INTERNAL ASSESSMENT 1

Course Outcomes

On successful completion of the course, students will be able to:

CO	Course Outcome Statement
CO1	Apply the principle of the foundational concepts of ethical hacking, including types of hackers, ethical principles, legal frameworks, and the role of responsible disclosure in cybersecurity.
CO2	Execute footprinting in social engineering such as DNS analysis, competitive intelligence gathering, and attack simulations to collect relevant information for identifying potential security risks.

Answer all the Questions

1. A private bank hires a security firm to test its internet-banking portal before launch. In the same month, a former employee uses old credentials to view customer records, a student runs a downloaded attack tool against the portal "to see what happens", and an activist group defaces the bank's website. Define the term hacker and classify each person or group, including the hired testers, as white hat, black hat, grey hat, script kiddie, hacktivist or insider, with reasons. Explain the ethical principles the testers must follow, such as written authorization, agreed scope, confidentiality, avoiding harm and honest reporting. (CO1) (BL3)

2. A student finds an SQL injection flaw in the e-learning portal of another university that exposes the marks and contact details of about 20,000 students, without having permission to test

it. The student is considering posting the details on social media, reporting privately to the university, or offering the details in exchange for payment. Analyze the legal position of the student under the Information Technology Act, 2000, with reference to unauthorized access and data theft. Compare full disclosure, responsible (coordinated) disclosure and bug-bounty programmes, and recommend the most appropriate disclosure process and timeline for this case with justification. (CO1) (BL4)

3. (a) A college authorizes its security club to carry out a penetration test of the student portal. Before any testing begins, the team must define how the engagement will be conducted. Apply the ethical-hacking methodology by listing its phases — reconnaissance, scanning, gaining access, maintaining access and reporting — and state the objective of each phase. Explain what a written rules-of-engagement / authorization document must specify (in-scope targets, time window, permitted and prohibited techniques, and the point of contact) to keep the engagement lawful, in-scope and non-destructive. (CO1) (BL3) (5 Marks)

(b) A security team is authorized to assess the internet exposure of a retail company that uses the domain retailco.example. Explain the difference between passive and active footprinting, and describe how the team would use WHOIS lookups, nslookup or dig, and search-engine operators (site:, filetype:, intitle:) to collect information about the company. For any THREE of these sources, state one item of information it may reveal and the security risk it creates.

(CO2) (BL3) (5 Marks)

4. During an authorized assessment, a tester runs "dig axfr example.com @ns1.example.com" and the name server returns the full zone, including www (A, 203.0.113.10), vpn (A, 203.0.113.25), hr-portal (A, 10.10.5.20), dev-db (A, 10.10.8.15), mail (MX, priority 10) and a TXT record listing the SPF mail servers. Explain how a DNS zone transfer works and why it is meant only between primary and secondary name servers. Analyze what an attacker could learn from each record to plan further attacks, and recommend countermeasures such as restricting transfers, TSIG authentication and split-horizon DNS. (CO2) (BL4)

5. An organization receives an e-mail that appears to come from its IT help desk, asking employees to "verify" their passwords through a link. Later, a caller claiming to be from the help desk asks the accounts section for a one-time password, and a visitor without an ID card follows an employee through a secured door. Identify each attack type (phishing, vishing, pretexting or tailgating) and the psychological principles used, such as authority and urgency. Describe how an authorized social engineering assessment of this organization should be planned, and propose technical, procedural and awareness-based countermeasures. (CO2) (BL3)
